Empathy Map Canvas

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes. It helps the project team understand the person who submits a network service request before designing the ServiceNow solution.

For this project, the map is built around the primary actor of the Network Request process — the Requester (an employee who needs to raise a network-related service request through the ServiceNow Service Portal). It reflects the problem context described in the project's problem statement and is used for ideation purposes only; it is not the output of a formal, separate user-research study.

Persona: Employee / Requester submitting a Network Request

Note: The Pains and Gains identified above directly correspond to the problem statement and objectives of the Network Request ServiceNow implementation — the automated workflow was designed specifically to remove these pains and deliver these gains.
