

Project Design Phase-II

Customer (Requester) Journey Map

Date	19 September 2026
Team ID	Shaik Irshad - 238W1A4256
Project Name	Automated Network Request Management In ServiceNow
Maximum Marks	4 Marks

A customer journey map lays out, phase by phase, what a person experiences, thinks, and feels while going through a process — and where the biggest opportunities are to improve it. The map below traces the Requester's journey through the actual Network Request implementation, from first realizing they need a network connection through to seeing the final Approved/Rejected outcome.

Scenario: discovering, submitting, and tracking a network service request end to end, across the five phases Entice → Enter → Engage → Exit → Extend.

SERVICENOW

Network Request Journey

SCENARIO
Discovering, submitting, and tracking a network service request end to end

	Entice		Enter		Engage			Exit		Extend	
Steps	How does the requester want to get started? Realizes a network connection is needed Learns about the IT Service Portal		What happens as they get started? Logs into the Service Portal Finds the Network Request catalog item		In the core moments, what happens? Fills in requester & connection details Enters Existing ID if applicable Enters payment info & submits			What happens as the request is submitted? Sees on-screen submission confirmation Receives email with request number		What happens after the request is submitted? Approver reviews & decides Requester checks final status	
Interactions	Self; own workspace/desk IT colleague; team chat		Service Portal login (SSO) Service Portal; Network category		Network Request form; Catalog Variables Existing ID field (Catalog UI Policy) Payment fields; Submit button			Confirmation screen / request number Email inbox; Flow-sent notification		sysapproval_approver record Approval Related List; Approval Status field	
Goals & Motivations	Help me know what to request Help me find the right place to ask		Help me get in without hassle Help me find the catalog item fast		Help me avoid re-typing my info Help me avoid mistakes if already connected Help me not miss a required field			Help me know it really went through Help me keep a reference number		Help me get a fair, timely decision Help me know exactly where I stand	
Positive Moments	Clear that IT needs can become a ticket Colleague points them straight to the portal		Single sign-on makes login painless "Network" category is easy to browse		Requester info auto-populates itself Field only appears when actually needed Validation catches mistakes early			Instant confirmation feels reassuring Email arrives with a clear request number		Routed automatically — no manual chasing Status visible in one place, no guesswork	
Negative Moments	Not obvious IT can help with this Portal existence isn't widely known		Portal feels unfamiliar for infrequent users Many categories can confuse first-time users		Connection-specific details still typed by hand "Existing ID" unclear without guidance Submission blocked if a field is missed			No visibility yet into who is approving Notification could get lost in a busy inbox		No estimate of how long approval will take No nudge if a request sits pending too long	
Areas of Opportunity	Promote this in IT onboarding / FAQs Add a portal shortcut on intranet pages		Offer a quick-start guide for new users Add search keywords to speed up discovery		Add contextual help next to unclear fields Add a tooltip on the Existing ID field Show validation messages inline, sooner			Show the assigned approver on screen Add a reminder if approval is pending		Track average approval turnaround time Send a proactive status-changed alert	

The Positive Moments and Negative Moments rows above are grounded directly in the project's problem statement (repetitive manual entry, unclear approval progress, uncertainty about submission, delays) and the objectives it was built to satisfy (standardized submission, auto-population, automated notification, and approval tracking). The Areas of Opportunity row reflects realistic, incremental improvements — not the larger future enhancements already tracked separately in the project's Brainstorming & Prioritization document (e.g. Cisco DNA/Ansible integration, multi-level approval, reporting dashboards).
