

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	19 September 2026
Team ID	Shaik Irshad - 238W1A4256
Project Name	Automated Network Request Management In ServiceNow
Maximum Marks	4 Marks

Functional Requirements

Following are the functional requirements of the proposed solution, grounded in the actual ServiceNow Network Request implementation.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Network Request Submission	Submit a Network Request through the ServiceNow Service Portal Enter requester, connection, payment and address details Mandatory-field validation before submission (Mobile Number, Type of Connection, Total Amount, Mode of Payment, Address)
FR-2	Dynamic Form Behaviour	Show the "Enter your Existing ID" field only when Type of Connection = Existing Hide the field when Type of Connection = New (Catalog UI Policy)
FR-3	Requester Information Auto-Population	Auto-populate Email ID from "Opened on behalf of" Auto-populate User Name from "Opened on behalf of" Auto-populate Phone Number from "Opened on behalf of" (Variable Set auto-population)
FR-4	Backend Record Creation	Create a record in the custom Database Tables table on submission Map catalog variables to backend fields (Address, Mobile Number, Mode of Payment, Requested For, Total Amount, Type of Connection) Auto-generate the Database Number (auto-number field) Set initial Approval Status = Requested
FR-5	Email Notification	Send an email to the requester when the request record is created Include a greeting, request information, and the generated request/database number
FR-6	Approval Workflow	Create an approval request (Ask for Approval) linked to the backend record Evaluate the approval decision (Approved / Rejected) Update the backend record's Approval Status based on the outcome
FR-7	Status Tracking & Traceability	Display related approval records on the Database Tables form via the Approval Request relationship Provide end-to-end visibility from submission to final Approved/Rejected status

Non-functional Requirements

Following are the non-functional requirements of the proposed solution. Each reflects capabilities inherited from the ServiceNow platform itself rather than custom-built infrastructure, consistent with the project's low-code, configuration-first approach.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	A single standardized Service Portal form with mandatory-field validation and dynamic show/hide of the Existing ID field reduces confusion and repeated manual data entry for the requester.
NFR-2	Security	Access to the custom Database Tables table and the catalog item is controlled by ServiceNow's default, auto-generated ACLs (role-based access control); no additional custom ACL framework was built. All portal traffic runs over the platform's standard HTTPS/TLS encryption.
NFR-3	Reliability	Flow Designer executes the same fixed sequence — create record, send email, request approval, update status — on every submission, so outcomes are consistent. Reliability was verified using Flow Execution Details, email logs and backend record checks during testing.
NFR-4	Performance	Flow Designer runs asynchronously in the background after submission, so the requester's Service Portal experience is not blocked while the backend record, email and approval request are being created.
NFR-5	Availability	The solution runs on ServiceNow's SLA-backed, multi-instance cloud hosting, so availability of the Service Portal, Flow Designer and approval engine is managed by the ServiceNow platform rather than by any infrastructure built for this project.
NFR-6	Scalability	As a scoped application on the ServiceNow Now Platform, the solution inherits the platform's native multi-instance cloud scalability; no custom scaling logic, load balancers or additional servers were built by the team.
