

Project Development Phase Model Performance Test

Date	20 September 2026
Team ID	Shaik Irshad - 238W1A4256
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Model Performance Testing:

S.No.	Parameter	Values	Screenshot
1.	Model Summary	ServiceNow automation setup for Network Request management using a Catalog Item, Catalog Variables, a custom table (Database Tables) and Flow Designer. Key components: • Network Request catalog item on the Service Portal (7 catalog variables + User Information variable set with auto-population) • Catalog UI Policy: Existing ID is visible only for an Existing connection • Flow Designer: Service Catalog trigger → Get Catalog Variables → Create Record → Send Email → Ask for Approval → Approved / Rejected update • Database Tables record with auto-numbered Database Number and Approval Status • Approval Request relationship (sysapproval_approver) shown as a related list • Default ACLs on the custom table Note: If the submitted data is valid, the record is created and sent for approval; otherwise the form shows an error and the request is not submitted.	Figure 1: Network Request workflow

S.No.	Parameter	Values	Screenshot
2.	Accuracy	Test Pass Rate - 100% 19 of 19 UAT test cases passed (0 failed) Workflow Outcome Accuracy - 100% Both approval paths updated the record correctly: Approved → Approval Status = Approved; Rejected → Approval Status = Rejected Note: this project is rule-based (no ML model), so accuracy is measured as the functional test pass rate instead of training / validation accuracy.	 Functional test results by area 19 / 19 test cases passed Pass rate 100% • 0 failed Form & validation (TC-001-007) 7/7 Submission, flow & record (TC-008-012) 5/5 Notification & approval (TC-013-017) 5/5 Security & end-to-end (TC-018-019) 2/2 Source: UAT test cases TC-001 to TC-019 Figure 2: Test result summary (from the UAT document)
3.	Confidence Score (Only Yolo Projects) Not applicable	Class Detected - Not applicable (no YOLO / object-detection model). Equivalent check: validation and error handling. Valid data is accepted; missing mandatory data shows an error and blocks submission. Confidence Score - Not applicable. Outcomes are rule-based and deterministic (mandatory-field validation, UI Policy and Flow Designer conditions), so no probability score is produced.	 <pre> graph TD Start([Requester clicks Submit]) --> Decision{All mandatory fields filled?} Decision -- No --> Error[Error shown Missing fields are flagged Submission is blocked Nothing is created] Decision -- Yes --> Accepted[Request accepted Record created Email sent Approval started] </pre> Mandatory: Mobile Number, Type of Connection, Total Amount, Mode of Payment, Address. Schematic of behaviour tested in TC-002 and TC-008. Figure 3: Validation and error handling

Figures 1 to 3 are design and result diagrams prepared for this project. Screenshots of the ServiceNow instance (Flow Execution Details, Email Logs, record and approval views) can be added to the Screenshot column as further evidence.
