Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Project Overview:

Project Name: Automated Network Request Management in ServiceNow

Project Description: A scoped ServiceNow application that lets users submit network-related requests through a Service Portal catalog item. Flow Designer creates a backend record, notifies the requester by email, routes the request for approval and updates the Approval Status to Approved or Rejected.

Project Version: 1.0

Testing Period: 18 September 2026 to 20 September 2026

Testing Scope:

Features and functionalities tested:

- Network Request catalog item (Service Catalog, Network category) on the Service Portal
- Catalog variables (7) and mandatory-field validation
- Catalog UI Policy: Existing ID visibility for Existing connections
- User Information variable set with auto-population of Email ID, User Name and Phone Number
- Flow Designer flow: Service Catalog trigger, Get Catalog Variables and Create Record
- Custom Database Tables table: fields, auto-numbered Database Number and initial Approval Status = Requested
- Email notification (Send Email action) and Email Log verification
- Approval (Ask for Approval) and the Approval Request related list
- Approved / Rejected condition logic and Approval Status update
- Default ACLs generated for the custom table

User stories / requirements tested:

- **US-01:** As a requester, I want to submit a network request through a structured Service Portal form so that request information is captured consistently. (TC-001, TC-008)
- **US-02:** As a requester, I want mandatory details to be enforced so that incomplete requests cannot be raised. (TC-002, TC-003, TC-006)
- **US-03:** As a requester, I want the Existing ID field to appear only for an Existing connection so that the form stays simple. (TC-004, TC-005)
- **US-04:** As a requester, I want my email, name and phone number filled in automatically from the selected user. (TC-007)
- **US-05:** As a requester, I want the request stored as a backend record with a unique number and the initial status Requested. (TC-009 to TC-012)
- **US-06:** As a requester, I want an email confirming that my request has been created. (TC-013)
- **US-07:** As an approver, I want an approval request generated for each request so that I can approve or reject it. (TC-014, TC-015, TC-016)

- **US-08:** As a requester, I want the request status updated automatically to Approved or Rejected. (TC-015 to TC-017)
- **US-09:** As an administrator, I want the custom table protected by the default ACLs. (TC-018)
- **US-10:** As a project owner, I want the full lifecycle to run without manual record handling. (TC-019)

Testing Environment:

URL/Location: ServiceNow instance – Service Portal, Network Request catalog item
(<https://dev439929.service-now.com/sp>)

Credentials (if required): Not recorded in this document for security reasons. Testing used a requester account to submit requests and the configured test/admin user as the approver.

Test Cases:

Summary: all test cases below were executed through the Service Portal and Flow Designer. Positive and negative scenarios are included (TC-002, TC-016). Result summary: 19 executed, 19 passed, 0 failed.

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Open the Network Request catalog item	1. Log in to the Service Portal as the requester 2. Open the Network category or search for "Network Request" 3. Open the Network Request catalog item	Catalog item opens showing Requested For, Mobile Number, Type of Connection, Total Amount, Mode of Payment, Address and the User Information variable set	Form opened with all variables and the User Information set displayed	Pass
TC-002	Mandatory-field validation (negative)	1. Open the Network Request form 2. Leave all fields empty 3. Click Submit	Submission is blocked and the mandatory fields (Mobile Number, Type of Connection, Total Amount, Mode of Payment, Address) are flagged	Request was not submitted; the required fields were flagged	Pass
TC-003	Optional fields left blank (positive)	1. Fill only the mandatory fields 2. Select Type of Connection = New 3. Leave Requested For and Existing ID blank 4. Click Submit	Request is accepted because these fields are not mandatory	Request submitted successfully	Pass
TC-004	Existing ID hidden for a New connection	1. Open the Network Request form 2. Select Type of Connection = New	"Enter your Existing ID" remains hidden	Field remained hidden	Pass
TC-005	Existing ID shown for an Existing connection	1. Open the Network Request form 2. Select Type of Connection = Existing	"Enter your Existing ID" becomes visible (Catalog UI Policy)	Field appeared when Existing was selected	Pass
TC-006	Choice values are available	1. Open the Type of Connection list 2. Open the Mode of Payment list	Type of Connection: New, Existing. Mode of Payment: UPI, CARD	All choices were listed as configured	Pass
TC-007	User information auto-population	1. In User Information, select a user in Opened on behalf of 2. Observe Email ID, User Name and Phone Number	Email ID, User Name and Phone Number are populated from the selected user's record	The three fields were populated automatically	Pass

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-008	Submit a valid request	1. Enter valid values in all mandatory fields 2. Click Submit	Request is submitted and a Requested Item is generated for the Network Request item	Request submitted successfully	Pass
TC-009	Flow triggered by a Service Portal submission	1. Submit a request from the Service Portal 2. Open Flow Designer › Executions (Flow Execution Details)	Network Request flow runs for the submitted item: trigger, Get Catalog Variables, Create Record and Send Email complete and Ask for Approval starts	Execution recorded and steps ran as expected (after BG-001 was fixed)	Pass
TC-010	Backend record creation and field mapping	1. Open the Database Tables list 2. Open the record created for the request 3. Compare its values with the submitted form	Record exists; Mobile Number, Total Amount, Mode of Payment, Type of Connection, Address and Requested For match the submitted variables	Record created; values matched the submission	Pass
TC-011	Auto-generated Database Number	1. Open the newly created record 2. Check the Database Number field	Number is generated automatically by the system (it is not mapped in the flow)	Unique number generated automatically	Pass
TC-012	Initial Approval Status	1. Open the newly created record 2. Check the Approval Status field	Approval Status = Requested	Approval Status showed Requested	Pass
TC-013	Email notification	1. Open the Email Logs 2. Find the email for the submitted request	Email sent to the Email ID from the User Information set, subject "Request has been Created", greeting the User Name and showing the request number	Email found in the log with the expected subject and content	Pass
TC-014	Approval request creation	1. Open the Database Tables record 2. Open the Approval Request related list	An approval record (sysapproval_approver) linked to the record is listed with state Requested	Approval record was listed for the request	Pass
TC-015	Approval outcome: Approved	1. Log in as the approver 2. Open the approval and click Approve 3. Open the request record	Approval Status is updated to Approved	Approval Status changed to Approved	Pass
TC-016	Approval outcome: Rejected (negative)	1. Submit a new request 2. Open the approval as the approver and click Reject 3. Open the request record	Approval Status is updated to Rejected	Approval Status changed to Rejected	Pass
TC-017	Flow Execution Details	1. Open Flow Designer › Executions 2. Open the runs for the approved and the rejected request	Every step shows a successful state; the approved run follows the If branch and the rejected run the Else branch; no failed steps	Both runs completed on the expected branch with no failed steps	Pass
TC-018	Default ACL verification	1. Open System Security › Access Control (ACL) 2. Filter by the Database Tables table name	Default ACLs generated with the custom table are present; no custom ACLs are needed	Default ACLs were present and applied to the table	Pass

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-019	End-to-end workflow	1. Submit a request on the Service Portal 2. Verify the record, number, Requested status, email and approval 3. Approve (or reject) and verify the final status	Full lifecycle runs automatically: Portal → record → email → approval → final status	Complete cycle worked as expected	Pass

Bug Tracking:

Bug ID	Bug Description	Steps to reproduce	Severity	Status	Additional feedback
BG-001	The Network Request flow ran successfully when tested in Flow Designer, but did not run when the request was submitted from the Service Portal.	1. Test the flow in Flow Designer: it succeeds 2. Submit a Network Request from the Service Portal 3. Check Flow Execution Details: the flow did not execute for the submission	High	Closed	Root cause: the catalog item was not associated with the flow (Flow / Process Engine association). Fix: the correct Network Request flow was linked to the catalog item. Verified by TC-009 and TC-019.

One defect (BG-001) was logged during testing; it was resolved and closed. No other defects were recorded.
